Linear Drive with Toothed Belt - selective with Integrated Recirculating Ball Bearing Guide or Integrated Roller Guide

The latest generation of high capacity linear drives, the OSP-E..BHD series combines robustness, precision and high performance. The aesthetic design is easily integrated into any machine constructions by virtue of extremely adaptable mountings.

Advantages:
• Accurate path and position control
• High force output
• High speed operation
• High load capacity
• Easy installation
• Low maintenance
• Ideal for multi-axis applications

Features:
• Integrated recirculating ball bearing guide or integrated roller guide
• Diverse range of multi-axis connection elements
• Diverse range of accessories and mountings
• Complete motor and control packages
• Optional integrated planetary gearbox
• Special options on request

To simplify design work OSP-E system CAD files are available, which are compatible with most common CAD systems.
OSP-E Series Electric Linear Drives and Guides

Features

Drive Shaft Versions
- Clamp Shaft
- Plain Shaft

Drive Shaft OPTIONS
- Clamp Shaft and Plain Shaft
- Hollow Shaft with Keyway
- OPTION Integrated planetary gearbox

- Highly compact and rigid solution fully integrated in the drive cap housing
- Purpose designed for the BHD series
- Available with three standard ratios (3, 5 and 10)
- Very low backlash
- A wide range of available motor flanges

The dovetailed mounting rails of the new linear actuator expand its function into that of a universal system carrier. Modular system components are simply clamped on

- Carriage
- Steel runner block with integrated scraper system and grease nipples
- Threaded mounting holes compatible with Proline series
- Slotted profile with dovetail grooves
- Permanent magnet for contactless position sensing
- BI-PARTING Version for perfectly synchronised bi-parting movements.
- Rollers on needle bearings for smooth operation up to 10 m/s.
- Corrosion resistant steel sealing band

MULTI-AXIS SYSTEMS
A wide range of adapter plates and intermediate drive shafts simplify engineering and installation

Linear Drive with Toothed Belt and Integrated Recirculating Ball Bearing Guide
Series OSP-E..BHD
Size 20 to 50

Standard Versions
- Toothed Belt Drive with integrated Recirculating Ball Bearing Guide
- Drive Shaft with clamp shaft or plain shaft
- Choice of motor mounting side
- Dovetail profile for mounting of accessories and the drive itself

Options
- Tandem version for higher moments
- Bi-parting version for synchronised movements
- Integrated planetary gearbox
- Drive shaft with
  - clamp shaft and plain shaft
  - hollow shaft with keyway
- Special drive shaft versions on request

Installation Instructions
Use the threaded holes in the end cap for mounting the linear drive.
Check if mid-section supports are needed using the maximum allowable unsupported length graph on page 17. At least one end cap must be secured to prevent axial sliding when mid-section support is used.

Maintenance
Depending on operating conditions, inspection of the linear drive is recommended after 12 months or 3000 km operation. Please refer to the operating instructions supplied with the drive.

First service start-up
The maximum values specified in the technical data sheet for the different products must not be exceeded. Before taking the linear drive machine into service, the user must ensure the adherence to the EC Machine Directive 91/368/EEC.

Sizing Performance Overview

**Maximum Loadings**

**Sizing of Linear Drive**

The following steps are recommended:

1. Determination of the lever arm length \( l_x, l_y \) and \( l_z \) from \( m_e \) to the center axis of the linear drive.
2. Calculation of the load \( F_x \) or \( F_y \) to the carrier caused by \( m_x \):
   
   \[ F_x = m_x \cdot g \]

3. Calculation of the static and dynamic force \( F_A \) which must be transmitted by the toothed belt.
   
   \[ F_A = F_x + F_y = m_x \cdot g + m_y \cdot \frac{2 \pi}{U_{Z_R}} \]

4. Calculation of all static and dynamic moments \( M_x, M_y, \) and \( M_z \) which occur in the application.
   
   \[ M = F \cdot l \]

5. Selection of maximum permissible loads via Table T3.
6. Calculation and checking of the combined load, which must not be higher than 1.
7. Checking of the maximum torque that occurs at the drive shaft in Table T2.
8. Checking of the required action force \( F_A \) with the permissible load value from Table T1.

For motor sizing, the effective torque must be determined, taking into account the cycle time.

**Legend**

- \( l_x, l_y, l_z \): distance of a mass in the \( x-, y-, \) and \( z \)-direction from the guide [m]
- \( m_e \): external moved mass [kg]
- \( m_{L_x} \): moved mass of linear drive [kg]
- \( m_y \): total moved mass \( (m_x + m_{L_x}) \) [kg]
- \( F_{x/y} \): load exerted on the carrier in dependence of the installation position [N]
- \( F_A \): action force [N]
- \( M_0 \): no-load torque [Nm]
- \( U_{Z_R} \): circumference of the pulley \( (\text{linear movement per revolution}) \) [m]
- \( g \): gravity \([m/s^2] \)
- \( a_{\max} \): maximum acceleration \([m/s^2] \)

**Important:**

The maximum permissible moment on the drive shaft is the lowest value of the speed- or stroke-dependent moment value.

**Example above:**

OSP-E25BHD, stroke 5 m, required speed 3 m/s from Table T2 speed 3 m/s gives 25 Nm and stroke 5 m gives 21 Nm. Max. torque for this application is 21 Nm.

When sizing Bi-parting units: for ordering stroke see page 18.

</table>
Maximum Permissible Unsupported Length – Placing of Mid-Section Support

The total of the loads must not exceed >1 under any circumstances.

### Equation for Combined Loads

\[
\begin{align*}
F_y (\text{max}) + F_z (\text{max}) + M_x (\text{max}) + M_y (\text{max}) + M_z (\text{max}) &= 1
\end{align*}
\]

For Bi-parting version the max. load \( F \) is the total load of both carriers

\[
F = F_{\text{carrier 1}} + F_{\text{carrier 2}}
\]

\[ k = \text{Max. permissible distance between mountings/mid-section support for a given load } F. \]

When loadings are below or up to the curve in the graph below the deflection will be max. 0.01 % of distance \( k \).

(Note: Other dimensions for KS and KB for special drive shafts on request – see order instructions.)
Integrated Planetary Gearbox

Features
• Highly compact and rigid solution fully integrated in the drive cap housing
• Purpose designed for the BHD series.
• Available with three standard ratios (3, 5 and 10)
• Very low backlash
• A wide range of available motor flanges

Please contact your local PARKER-ORIGA technical support for available motor flanges.

Material:
Aluminium (AL-H) / Steel (St-H)

Standard Version:
• Gearbox on opposite side to carrier.

Note:
When ordering, specify model/type of motor and manufacturer for correct motor flange.

Linear Drive with Toothed Belt and Integrated Roller Guide

Series OSP-E..BHD
Size 25, 32, 50

Standard Versions
- Toothed Belt Drive with integrated Recirculating Ball Bearing Guide
- Drive Shaft with clamp shaft or plain shaft
- Choice of motor mounting side
- Dovetail profile for mounting of accessories and the drive itself

Options
- Tandem version for higher moments
- Bi-parting version for synchronised movements
- Integrated planetary gearbox
- Drive shaft with
  - clamp shaft and plain shaft
  - hollow shaft with keyway
- Special drive shaft versions on request

Installation Instructions
Use the threaded holes in the end cap for mounting the linear drive.
Check if mid-section supports are needed using the maximum allowable unsupported length graph on page 17. At least one end cap must be secured to prevent axial sliding when mid-section support is used.

Maintenance
All moving parts are lifetime-lubricated. Depending on operating conditions, inspection of the linear drive is recommended after 12 months or 3000 km operation. Please refer to the operating instructions supplied with the drive.

First service start-up
The maximum values specified in the technical data sheet for the different products must not be exceeded. Before taking the linear drive machine into service, the user must ensure the adherence to the EC Machine Directive 91/368/EEC.
Sizing Performance Overview

Maximum Loadings

Sizing of Linear Drive

The following steps are recommended:
1. Determination of the lever arm length \( l_x, l_y \) and \( l_z \) from \( m_k \) to the center axis of the linear drive.
2. Calculation of the load \( F_x \) or \( F_y \) to the carrier caused by \( m_k \):
   \[ F = m_k \cdot g \]
3. Calculation of the static and dynamic force \( F_z \), which must be transmitted by the toothed belt:
   \[ F_{Ax(\text{horizontal})} = F_x + F_y = m_k \cdot a + m_k \cdot 2\pi \cdot U_{2R} \]
   \[ F_{Ay(\text{vertical})} = F_x + F_y + F_z = m_k \cdot g + m_k \cdot a + m_k \cdot 2\pi \cdot U_{2R} \]
4. Calculation of all static and dynamic bending moments \( M_x, M_y, M_z \) which occur in the application
5. Selection of maximum permissible loads via Table T3.
6. Calculation and checking of the combined load, which must not be higher than 1.
7. Checking of the maximum torque that occurs at the drive shaft in Table T2.
8. Checking of the required action force \( F_x \) with the permissible load value from Table T1.

For motor sizing, the effective torque must be determined, taking into account the cycle time.

Legend

- \( \mathbf{F} \) = force [N]
- \( \mathbf{M} \) = torque [Nm]
- \( \mathbf{F}/\mathbf{M} \) = actions / moments [Nm]
- \( \mathbf{U} \) = circumference of the pulley [m]
- \( \mathbf{g} \) = gravity [m/s²]
- \( a_{\text{max}} \) = maximum acceleration [m/s²]

Important:
The maximum permissible moment on the drive shaft is the lowest value of the speed- or stroke-dependent moment value.

Example above:
OSP-E25BHD, stroke 5 m, required speed 3 m/s from table T2
speed 3 m/s gives 25 Nm and stroke 5 m gives 21 Nm. Max. torque for this application is 21 Nm.

When sizing Bi-parting units: for ordering stroke see page 23.
Combined Loads
If the linear drive is subjected to several forces, loads and moments at the same time, the maximum load is calculated with the equation shown here. The maximum permissible loads must not be exceeded.

\[
\begin{align*}
F_y (\text{max}) & + \ F_z (\text{max}) & + \ M_x (\text{max}) & + \ M_y (\text{max}) & + \ M_z (\text{max}) & \leq 1
\end{align*}
\]

The total of the loads must not exceed \( >1 \) under any circumstances.

Maximum Permissible Unsupported Length – Placing of Mid-Section Support

Stroke Length
The stroke lengths of the linear drives are available in multiples of 1 mm up to 5700 mm.
Other stroke lengths are available on request.

The end of stroke must not be used as a mechanical stop.

Allow an additional safety clearance at both ends equivalent to the linear movement of one revolution of the drive shaft, but at least 100 mm.
The use of an AC motor with frequency converter normally requires a larger clearance than that required for servo systems.

For advice, please contact your local PARKER-ORIGA technical support department.

* For the bi-parting version the maximum load (F) complies with the total of the load at both carriers.

\[ F = F_{\text{carrier 1}} + F_{\text{carrier 2}} \]

k = Maximum permissible distance between mountings/mid-section support for a given load F.
If the loads are below or up to the curve in the graph the deflection will be max. \( 0.01 \% \) of distance k.
